# Welcome to AuthPair

Firebase Authentication by Pairing Code

AuthPair is an easy-to-use device-pairing-solution with Firebase Authentication.

Easy sign in with any platform (Google, Facebook, Microsoft, Twitter,...) through pairing code and authentication page - perfect for all VR/AR devices.

AuthPair works out of the box - no coding skills required!

Get Started

AuthPair works out of the box, by using authpair.web.app as authentication URL!

Just start with the Demo scene or drag the AuthPair prefab form the Prefabs folder to your existing scene.

THATS ALL! Now just play the scene and click "Sign In". The AuthPair prefab contains everything you need to start.

For more details and adjustments see: authpair.web.app/help

NOTE: Even if AuthPair works out of the box, you should set up your own authentication URL with your own Firebase project to manage your users -> see Set up your own auth URL
